Summary

I am a Software Architect with a robust expertise in designing event-driven microservice architectures that prioritize reliability and performance. With four years of experience, I focus on building scalable solutions and implementing DevOps best practices. My key achievements include significantly reducing incident detection latency and enhancing system uptime, demonstrating my dedication to creating efficient software solutions

Experience

Visibility Bots

Software Architect – Platform Engineering

01/2025 - Present

A company that develops IoT-based solutions

- Architected event-driven microservices backend (Node.js, MQTT) for device telemetry ingestion with Redis pub/sub inter-service messaging – achieved 99.7% uptime and reduced incident detection to under 2 minutes
- Engineered write/read separation pattern scaling ingestion services independently from query services, eliminating bottlenecks in real-time dashboard synchronization via WebSocket
- Designed cross-platform React component library with platform-agnostic business logic layer, consumed by web dashboard and React Native mobile app – reduced code duplication by 60% and achieved synchronized feature parity
- Established distributed tracing with correlation IDs, circuit breaker patterns for external dependencies, and graceful degradation strategies maintaining core functionality during partial failures

Autorobos

Software Engineer – Full-Stack Architecture

03/2023 - 12/2024

Robotic solutions and enterprise software platform

- Led Next.js migration with hybrid rendering strategy (SSR for personalized dashboards, SSG for marketing, API routes for backend) – improved page load times by 50% (4.2s → 2.1s)
- Decomposed monolithic application into bounded microservices with API gateway for routing and authentication, implementing Redis caching and PostgreSQL read replicas – reduced response time by 50% (800ms → 400ms)
- Architected infrastructure-as-code deployment: Docker containerization with blue-green deployments and automated health-check rollback – achieved 99.5% availability SLA and reduced deployment time from 45 to 8 minutes

TZL Dynamics

Software Engineer – Technical Leadership

02/2023 - 07/2024

Remote – Web solutions and platform development

- Optimized full-stack performance: backend connection pooling with prepared statements, frontend React Window virtualization with progressive image loading, multi-layer caching (database, API, CDN) – reduced end-to-end latency by 63% (7s → 2.6s)
- Established technical leadership: led Agile ceremonies, conducted architectural reviews, mentored 2 junior engineers on full-stack patterns – achieved 95% test coverage and reduced production incidents by 40%

AikSol

Associate Software Engineer (Frontend) – Application Development

07/2021 - 02/2023

Software development company offering innovative solutions

- Architected full-stack enterprise applications: Node.js/Express API with JWT and RBAC, React TypeScript component library with adapter pattern for third-party integrations – reduced development time by 30% across CRM and e-commerce platforms
- Optimized MongoDB data layer with aggregation pipelines, strategic indexing, and schema normalization patterns – improved dashboard query performance by 70% (5s → 1.5s) while maintaining data consistency

Education

National University of Computer and Emerging Sciences (NUCES-FAST)

Islamabad, Pakistan

Bachelor of Science in Electrical Engineering, (Computer Engineering)

08/2018 - 11/2022

Key Achievements

 High-Performance System Design and Reliability

Achieved a sustained uptime of 99.7% for the telemetry platform while minimizing incident response time, showcasing a commitment to high-performance system design
